

**Stainless Steel**

Primarily mixture of
301/304 with minimal
430

430 magnetic with rolled
on finish

430/201

- **Krowne Underbar** - Mixture of 304, 301
- **Glastender Underbar** - Mixture of 430 and 201.
- **Perlick Underbar** - All 430 magnetic with rolled on finish resulting in dull brown/blue finish. Cheaper quality.
- **304** - Premium, most expensive, more nickel more chromium. More corrosion resistant than 201 and 430. Has a high shine and finish that lasts.
- **301** - Far better than 201 and 430 due to increased nickel and chromium, very similar to 304 and can be interchanged without issue. More corrosion resistant than 201 and 430. Has a high shine and premium finish that lasts.
- **201** - not magnetic but substantially less strong than 300 series due to reduced carbon content. Cheaper steel that also corrodes easily due to reduced nickel. 201 also wears quickly and might look shiny at first, but will quickly dull and darken over time.
- **430** - magnetic steel, cheaper, magnetic and corrodes easier than 300 series. Good for hidden places like side and back, not good for front and top. Less nickel and chromium results in reduced corrosion resistance. Has a dull finish.
